ZTH - Case Study

A) Integrating a New Export Finance Vertical

Background-

About ZTH

ZTH is a business and financial services platform working with companies, founders and businesses across **capital, fundraising, financial structuring, strategic growth and technology**. ZTH operates through multiple verticals that work together as part of a broader business ecosystem rather than as completely separate services.

The current ZTH structure can be broadly understood through **three core business verticals**:-

1. Capital & Fundraising
This vertical focuses on helping companies and founders access and navigate capital. It includes fundraising support, investor connections, capital-network activities and related financial opportunities. The existing **Capital Network** is part of this ecosystem, connecting businesses with the broader capital and fundraising network.

2. Financial & Strategic Structuring
This vertical focuses on structuring financial opportunities and solutions around the specific requirements of a business. This can involve understanding a company's financial situation, identifying suitable financial routes and structuring opportunities around growth, capital requirements and business objectives.

3. Business & Growth
This vertical focuses on helping businesses move beyond simply accessing capital and towards growth, partnerships and strategic opportunities. It connects financial requirements with broader business objectives and potential growth opportunities.

Alongside these business verticals, ZTH also has a **Technology Vertical**.

4. Technology
The Technology vertical focuses on building software, digital products and technology systems that support businesses and ZTH's own operations. This includes SaaS products, internal technology infrastructure, automation, data-driven systems and technology-enabled business solutions.

Together, these verticals form the broader ZTH ecosystem, where **capital, financial structuring, business growth and technology can work together to solve different stages of a company's requirements.**

The current ZTH website communicates these offerings through an established structure and visual identity. One of its existing areas is the **Capital Network**, which connects into ZTH's broader capital and fundraising ecosystem.

The Case

ZTH is now exploring a new vertical around **Export Finance**.

Businesses involved in exporting goods can often face a financing gap between fulfilling an international order and receiving payment from the buyer. Export finance can help businesses manage this working-capital requirement and support their international operations.

ZTH wants to introduce this capability through its existing website.

However, **ZTH does not want to redesign or rebuild its website from scratch.**

The challenge is to determine **how Export Finance can naturally become part of the existing ZTH website and business ecosystem.**

Your Challenge

Imagine you are working with the ZTH product/design team.

Your task is to design a website experience that introduces **Export Finance** while maintaining the existing ZTH website's structure, identity, and overall experience.

You must decide **where and how the new vertical should be integrated.**

For example, you may choose to expand the existing **Capital Network** section, introduce Export Finance as a new section within the current structure, create a dedicated service experience, or take another approach that you believe is more effective.

There is no single correct solution.

What matters is **why you chose your approach and how effectively you integrate it into the existing website.**

What We Want to See

Your solution should demonstrate how a user would:

Discover → Understand → Evaluate → Take Action

Think about the information that needs to be presented, how the service should be positioned, and what the appropriate **CTA** should be.

The design should feel like a **natural extension of ZTH**, rather than a completely separate website.

Along with the design, briefly explain your reasoning:

Why did you choose this structure?
How did you integrate Export Finance into the existing website?
What problem does your approach solve?
Why did you choose your CTA and user flow?

Deliverable

Create a **single-page website experience** demonstrating your proposed integration.

(Should be same not too Different or New from Existing)

You may submit:

- **Figma link**, or Canva Design for the Section or
- **Live/deployed website (Vercel or equivalent)**

A short explanation of your design and product decisions should accompany the submission.

Evaluation

The submission will primarily be evaluated on:

UI/UX — clarity, hierarchy, usability and visual communication.

Problem Solving — how well you understand and solve the integration problem.

Integration — how naturally Export Finance fits into the existing ZTH website.

Information Architecture — how you organize and present the new offering.

User Journey & CTA — how effectively you move the user from understanding the service to taking action.

Design Thinking — the reasoning behind your decisions and how well they address the business objective.

Execution — the quality and completeness of the final experience.
